Foreword	i
1. Scope	1
2. Terminology	4
3. Basic principles	8
3.1 General	8
3.2 Performance requirements for serviceability, structural safety and service life	8
3.2.1 Serviceability	8
3.2.2 Structural safety	8
3.2.3 Service life	9
3.3 Target reliability principles including uncertainty treatment	9
4. Procedures for the assessment of concrete structures	12
4.1 General procedures for the assessment of a structure	12
4.2 Preliminary investigation	12
4.2.1 Review of existing information	12
4.2.2 Condition survey of the structure	13
5. Properties of materials in existing structures	16
5.1 General	16
5.2 Concrete strength	17
5.2.1 General and range of applicability	17
5.2.2 Classification of concrete by strength based on drilled cylinders	17
5.2.3 Determination of compressive strength based on indirect methods	21
5.2.4 Lower limit of representative strength based on information from comparable structures	21
5.2.5 Special considerations with regard to the relation between the axial tensile strength and the splitting tensile strength in existing structures	22
5.2.6 Physical properties of deteriorated concrete in existing structures	24
5.3 Reinforcing steel	32
5.3.1 Classification by strength	32
5.3.2 Classification by nominal values of strength	32
5.3.3 Properties of reinforcing steel subjected to deterioration	33
5.3.4 Stress - strain relations for reinforcing steel for static and cyclic conditions	39
5.4 Prestressing steel	47

6.	Bond	53
6.1	Bond of corroded bars (plain and ribbed)	53
6.1.1	Test results	53
6.1.2	Modelling bond of corroded reinforcement	54
6.2	Bond of corroded prestressing reinforcement	66
6.2.1	Corrosion effects	66
6.2.2	Tendon fracture and new anchorage	66
6.2.3	Air voids and corrosion	67
6.2.4	Other problems	67
6.2.5	Bonded pretensioned wires and strands	67
6.2.6	Bond deterioration tests	68
6.3	Bond of steel in deteriorated concrete	68
6.3.1	Bond of steel reinforcement in ASR attacked concrete	68
6.3.2	Bond of steel reinforcement in frost-damaged concrete	71
7.	Assessing the bearing capacity of existing structures	76
7.1	General	76
7.2	Methods to determine the distribution of moments, normal forces and shear forces in existing structures	77
7.2.2	Analysis based on linear elastic behaviour	77
7.2.3	Analysis based on linear elastic behaviour with limited redistribution	77
7.2.4	Analysis by strut and tie models	78
7.2.5	Upper bound models of the theory of plasticity	79
7.2.6	Analysis by nonlinear finite element analysis	79
7.2.7	Verification by proof loading	79
7.3	Extending design models to assessment models	80
7.3.1	General	80
7.3.2	Shear resistance of slabs	80
7.3.3	Shear capacity of structural concrete members reinforced with plain steel bars	81
7.3.4	Punching shear resistance of slabs : the effect of compressive membrane action	84
7.3.5	Shear capacity of slabs without shear reinforcement under sustained loading	90
7.3.6	Determining the effective depth of structures in areas with inclined prestressing tendons and reinforcing steel for optimum analysis of the shear capacity in case of low shear reinforcement	94

7.4 Assessment of the bearing capacity of structures with deteriorated or damaged components	99
7.4.1 General considerations	99
7.4.2 Effects of corrosion of reinforcing steel on the bearing capacity of concrete structures	102
7.4.3 Development of deterioration in time: remaining uncertainties	105
7.4.4 Verification of bending resistance of structural members subject to deterioration	110
7.4.5 Determination of bearing capacity of deteriorated members subjected to bending and normal force	113
7.4.6 Anchorage verification	113
7.4.7 Determination of shear resistance of concrete members with corroded reinforcement	115
7.4.8 Shear capacity of concrete slabs suffering concrete deterioration	122
7.4.9 Effect of pre-cracking on the shear resistance	124
7.4.10 Behaviour of deteriorated structures subjected to cyclic and dynamic loading	124
7.4.11 Verification of remaining service life	126
7.5 Assessment of structures with non-compliant details under predominantly static and cyclic loading	127
7.5.1 General considerations	127
7.5.2 Effect of details	129
7.5.3 Resistance of non-compliant structural elements to cyclic loading	131
7.6 Assessments by numerical simulation	138
7.6.1 Introduction	138
7.6.2 Finite element models	138
7.6.3 Geometrical aspects	139
7.6.4 Material models for concrete	139
7.6.5 Material models for reinforcements	140
7.6.6 Material models for concrete-reinforcement interaction	140
7.6.7 Effects of steel corrosion	141
7.6.8 Effects of alkali–silica reaction	141
7.6.9 Effects of freeze-thaw cycles	141
7.6.10 Finite element discretisation	141
7.6.11 Loading sequence and load incrementation	141
7.6.12 Equilibrium iteration and convergence criteria	141
7.6.13 Documenting and reporting results	142

7.7 Verification assisted by proof loading	142
7.7.1 Introduction	142
7.7.2 Basic principles	143
7.7.3 Procedures for proof loading	147
7.7.4 Loading protocol	150
7.7.5 Stop criteria	152
7.7.6 Acceptance criteria	153
